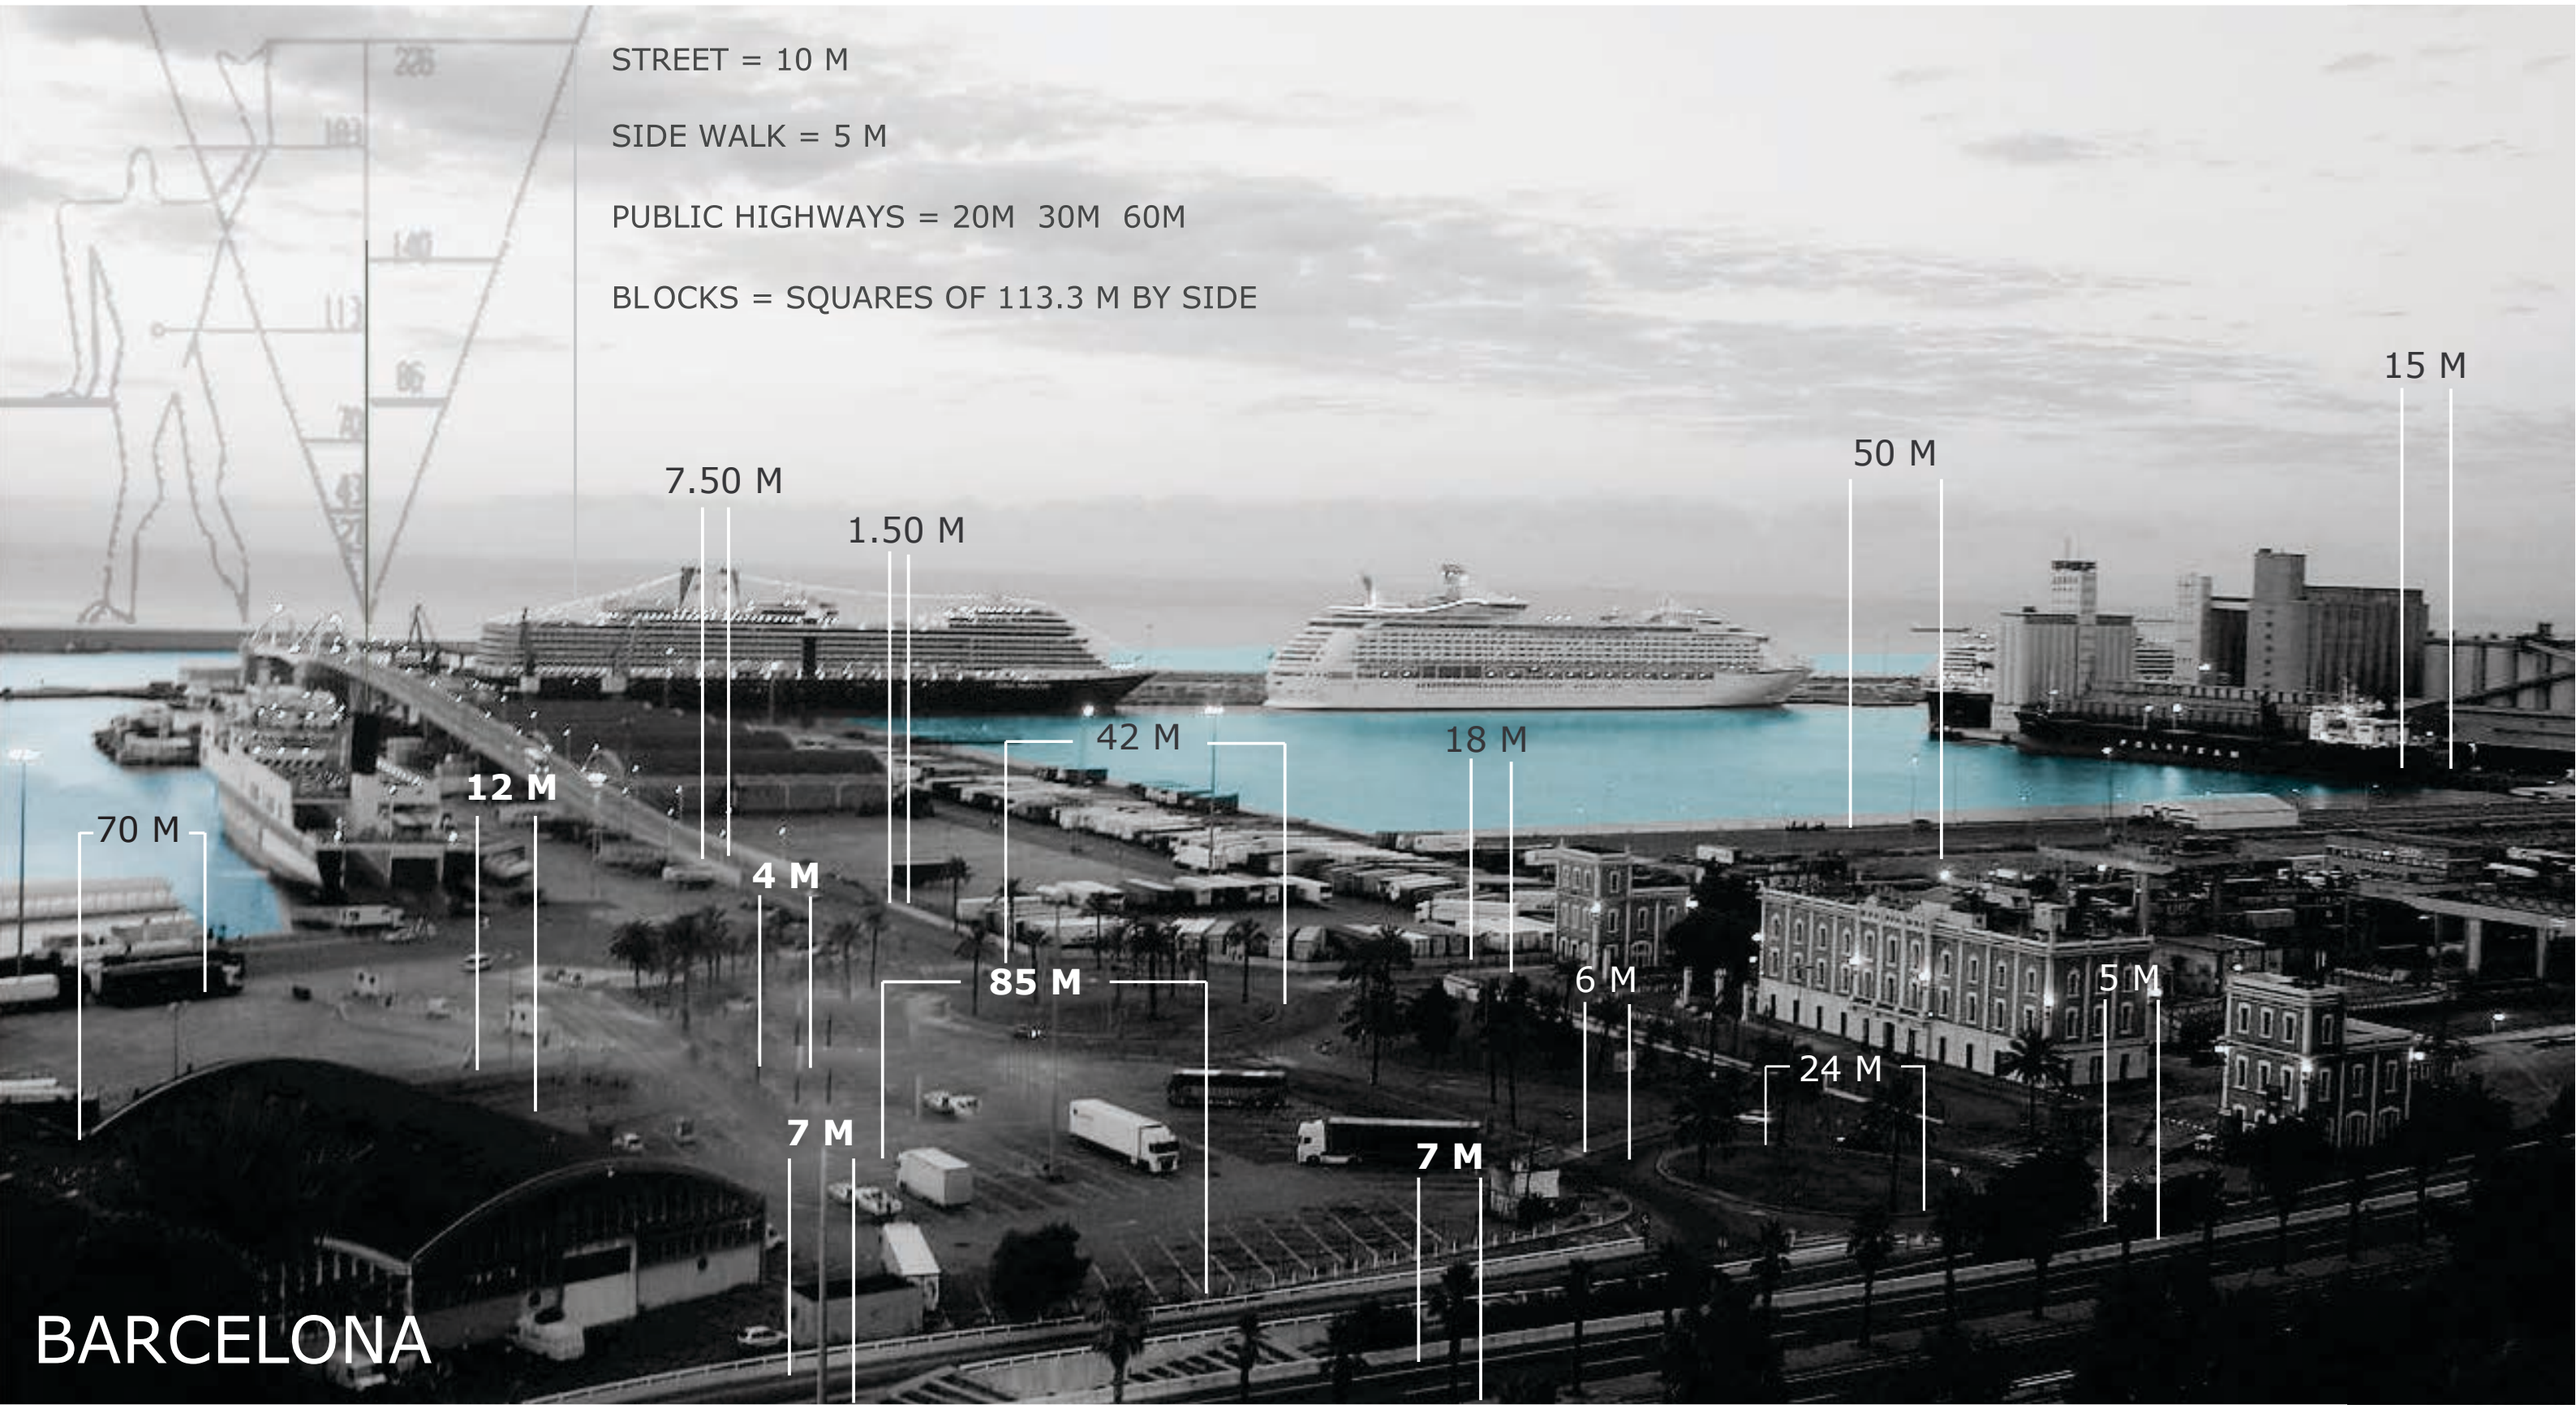
Hyperbordered Port

DS1 EMERGENT TERRITORIES
Faculty: Willy Müller, Maite Bravo
Group 2: **Alejandro Nuñez**, **Jesus Sapien**, **Diana Leon**



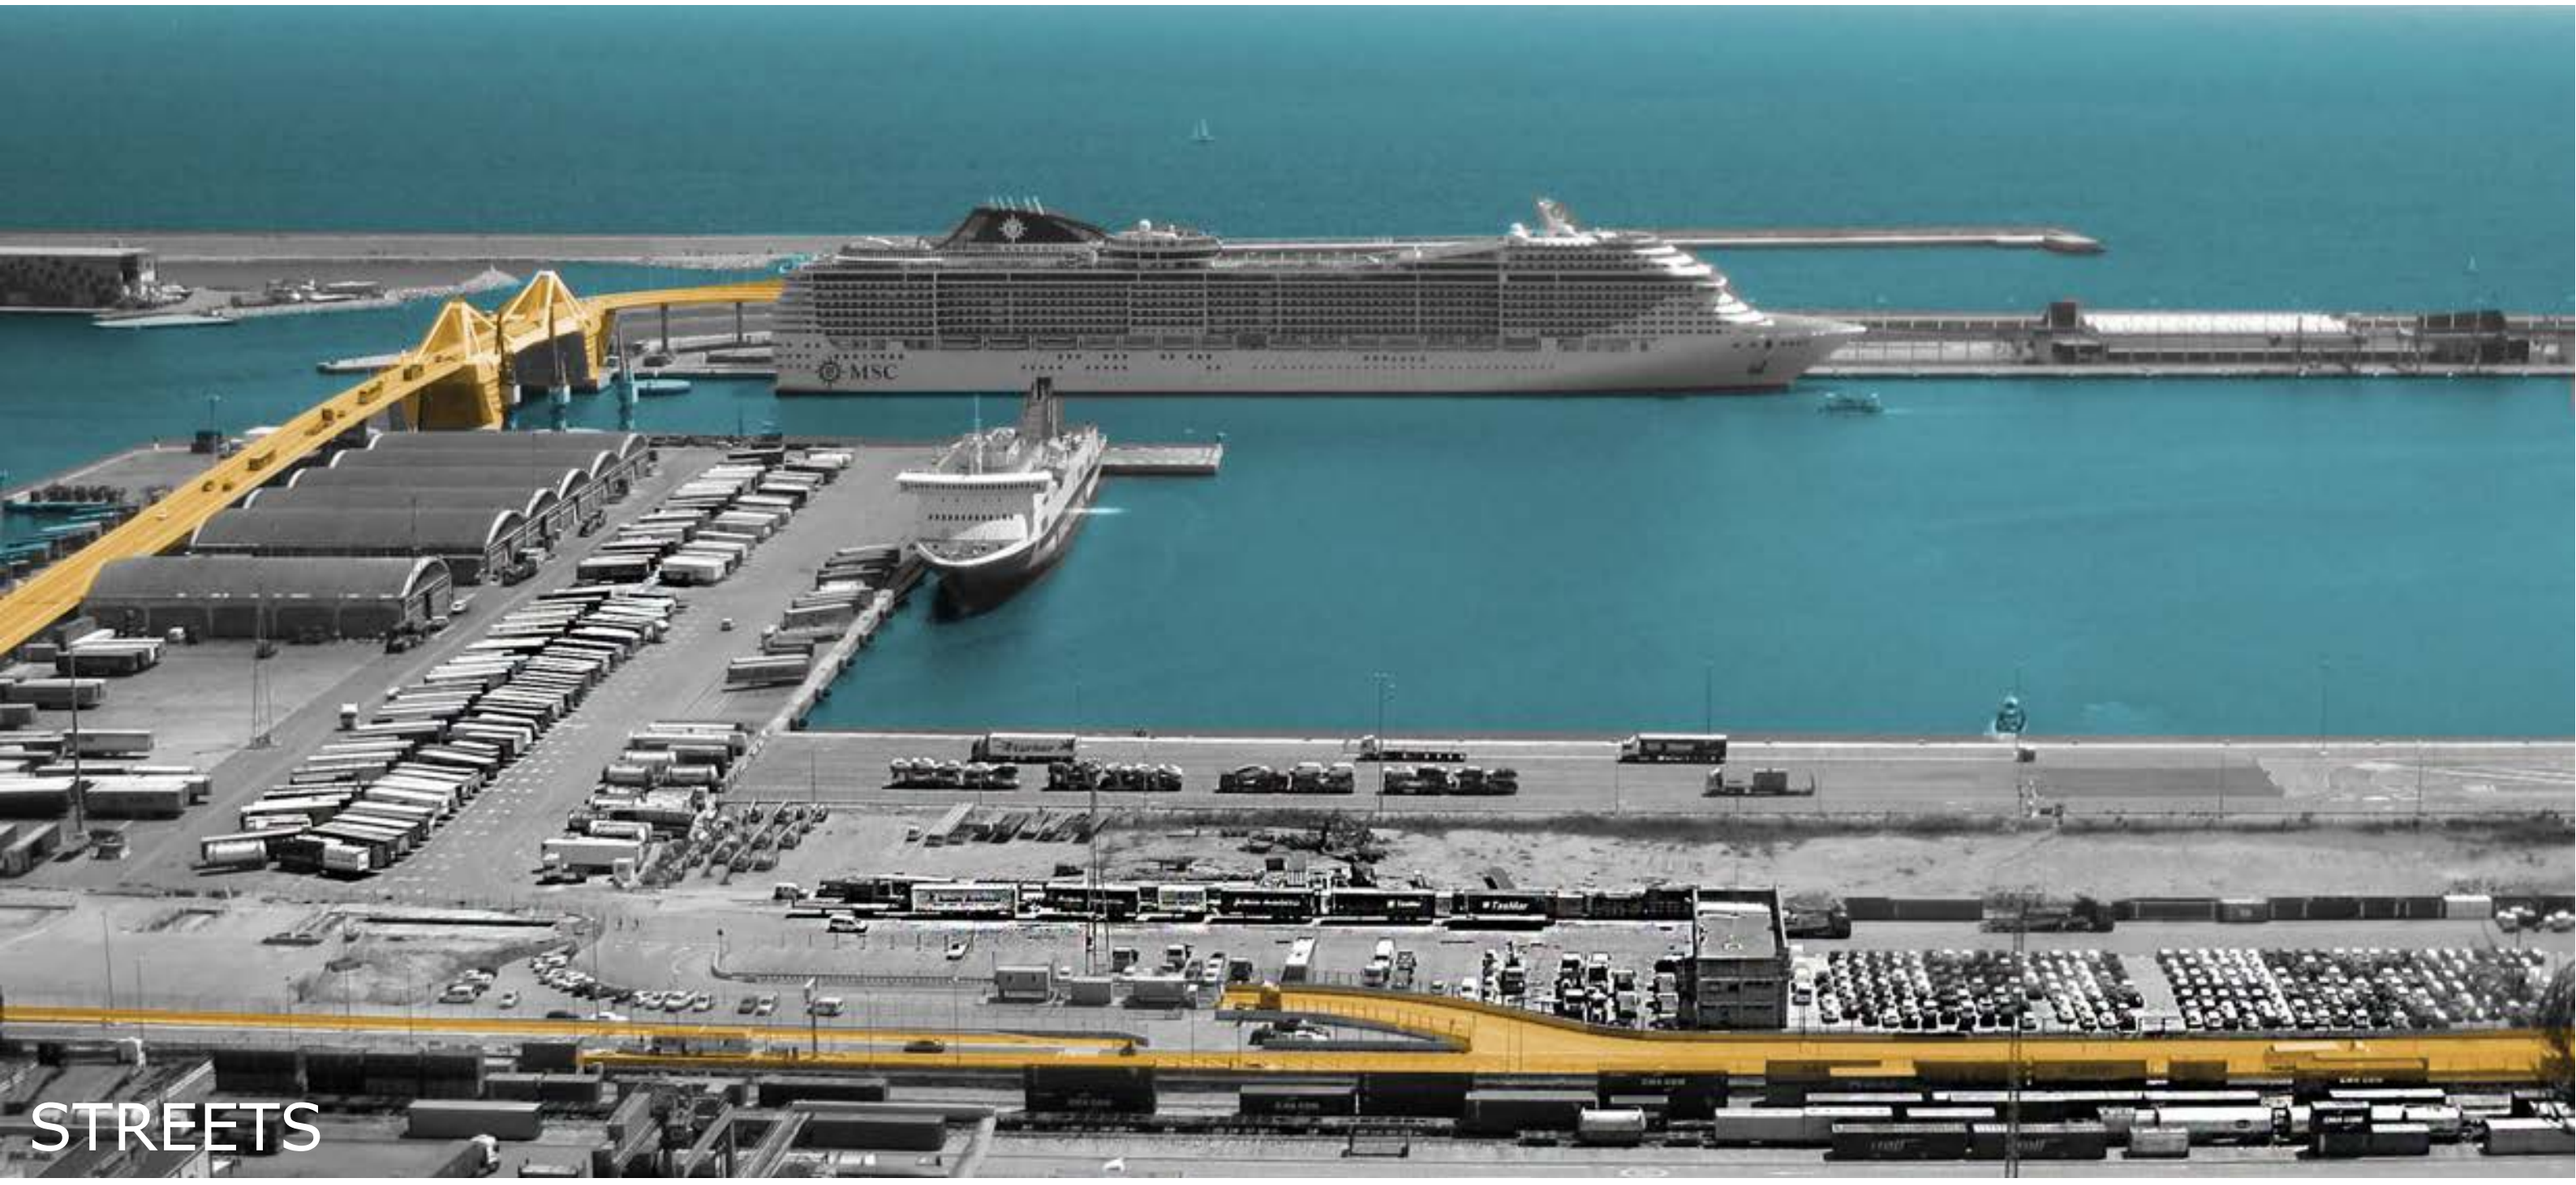
Cities as Barcelona were built based on general data sources. However the new design agenda requires to take into account the wider context of organization, systems, people, time, and even legal and political contexts. The integration of sensing an d actuation technologies in the urban settings will change the way people replay to the public spaces.

BARCELONA PORT

The borders in the port defines the physical infrastructure required for the activities in the site.

WATERFRONT

In the port, the dock line is a designated zone exclusively for ships, cruisers and ferries.



STREETS

Roads determine and restric the pedestrian and vehicular accesibility to the site.

STORAGE ZONES

The storage zone is occupied only containers, vehicles and trucks.

Could the borders in the port be configured by real time data generated by the city?

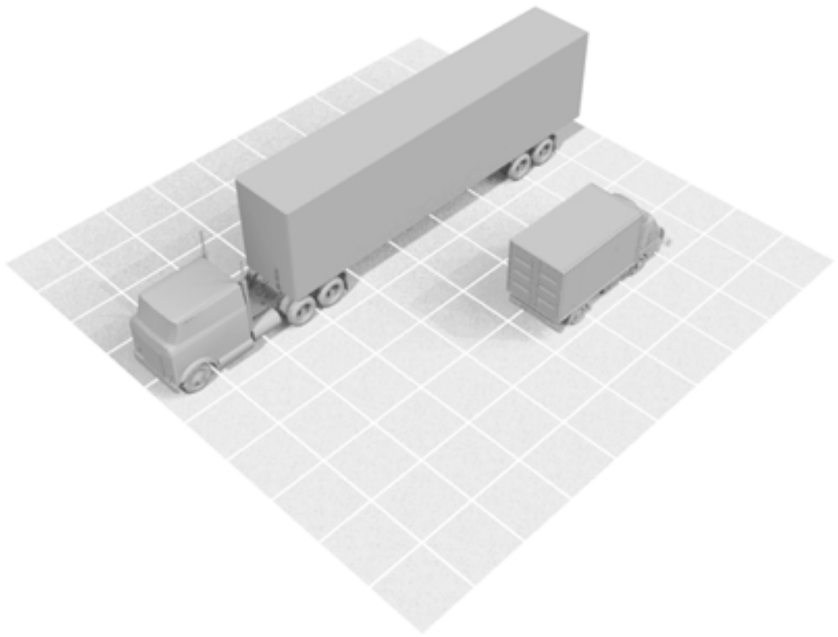
GRID BEHAVIOR DETAIL / **SATURDAY**



Starting Point (Grid at 0)

When the grid is at 0 (resting mode, without any specific imput defining public space or any other special behaviors) space will remain flat, providing a surface that facilitates the overall traffic, specially the transit of containers to and from the storage area.
